<https://ibrahimismail.dev>

Senior Full-Stack Engineer with 5+ years of experience specializing in high-performance frontend architectures, browser extension development, and robust backend API ecosystems. Proven track record of leading engineering teams and owning the complete SDLC for enterprise-grade security and authentication software. Expert at identifying system bottlenecks, resulting in concrete wins like an 8x build optimization and a 10x scalability increase. Deeply adaptable across modern tech stacks with extensive experience integrating advanced AI-driven workflows to accelerate product velocity. Available immediately.

TECHNICAL SKILLS

Backend & API Engineering: Node.js, TypeScript, Express.js, Java, Python, Flask, PHP, GraphQL, REST APIs, Webhooks, gRPC with Protocol Buffers (Protobuf).

Frontend Architecture: React, Vue, Next.js, TypeScript, JavaScript, Micro-frontends, Browser Extensions (Manifest v2/v3), SASS/CSS, Tailwind, Responsive Mobile-First Design.

Database Systems: PostgreSQL, MySQL, MongoDB, Database Migrations & Schema Design.

DevOps & CI/CD Pipelines: GitHub Actions, CircleCI, Docker, ArgoCD, Kargo, Cloudflare Registrar.

PROFESSIONAL EXPERIENCE

JumpCloud, Colorado, US (Remote) — Software Engineer

FEB 2022 - May 2026 (4+ years)

JumpCloud is a unified identity and device management platform (SSO, MFA, Zero Trust, RADIUS) securing Windows, macOS, Linux, and Mobile devices.

Ownership & Technical Leadership

- Lead the Password Manager browser extension team, owning the full SDLC — architecture, delivery process, testing strategy, staged rollout, and production support — for a security product shipped to every major browser.
- Onboard and mentor engineers, run knowledge-transfer sessions, and interview candidates across the hiring pipeline with hire recommendations.

Architecture & Platform Engineering

- Re-architected the password manager browser extension for Manifest V3, replacing a persistent background script with an ephemeral service worker and designing a new message-passing layer connecting the service worker, popup, injected page dialogs, and the desktop client.
- Rebuilt the entire extension UI against a new design system while migrating the codebase from React to Vue, delivered incrementally without disrupting the release cadence.
- Extended the platform to Safari, authoring a native Swift bridge for low-level IPC with the macOS desktop application, and contributed across the cross-platform Electron desktop app.
- Build and ship admin portal features as independently deployable microfrontends, working within a distributed frontend architecture where multiple teams release into a shared application shell on separate cadences.

Backend & Distributed Systems

- Designed and shipped the custom roles authorization system end to end: backend CRUD endpoints, database migrations for new permission scopes, a new scope-evaluation engine governing access across the admin portal, and

support for admins holding multiple roles.

- Built a metadata-driven roles UI that dynamically renders scope categories, type-split tables, and inter-scope dependencies — so new permissions ship server-side with zero frontend changes.
- Built an icon-streaming service with client-side caching, integrating third-party GraphQL APIs and consuming webhooks to keep application metadata current as upstream sources change.
- Build and consume services across a microservices architecture, defining typed contracts with gRPC and Protocol Buffers and owning deployment through multiple environments.

Security Engineering

- Implemented secure peer-to-peer communication between extension and desktop client, including the underlying cryptography: key generation, key exchange, key rotation, and combined symmetric/asymmetric encryption.
- Built JumpCloud Go, a browser extension enabling cross-platform biometric, passwordless authentication to the User Portal; hardened the credential autofill engine with user-defined autofill rules, per-site exceptions, and allow/deny listing.

Performance, Scale & Delivery

- Scaled the vault 10× — from 5,000 to 50,000 items — through caching, lazy loading, and list virtualization; rebuilt the peer-sync mechanism to raise throughput and eliminate memory leaks.
- Replaced a legacy Gulp workflow with a Webpack build pipeline, cutting build times 8× (4 minutes → 30 seconds).
- Own CI/CD for the extension: automated debug and production builds and distribution to all major browser stores, migrated from CircleCI to GitHub Actions.
- Drive release safety and reliability in an Agile Scrum team — feature-flagged rollouts (LaunchDarkly, Split), DataDog observability, and hands-on incident response including rollbacks and root-cause analysis.
- Introduced AI-assisted development workflows across the team (Cursor, GitHub Copilot, Gemini, agent skills, MCP servers) to increase engineering velocity.

MYKI, Beirut, Lebanon — Software Engineer

SEP 2021 - FEB 2022 (6 months)

A decentralized password management company serving global businesses and MSPs (Acquired by JumpCloud).

- Led the development efforts for the flagship password manager browser extension, shipping key updates, strengthening cross-browser stability, and refining automated credential autofill logic.

Neo Mena Technologies, Beirut, Lebanon — Software Engineer

DEC 2020 - SEP 2021 (9 months)

A premier FinTech corporation specializing in wealth management and modern digital investment applications.

- Translated UX wireframes into highly performant, fully responsive frontend views using **React** and **SASS**.
- Independently managed a standalone project, introducing full localization, dark mode, and other features.

EDUCATION

Master of Science in Computer Engineering **LIU, Beirut, Lebanon**

SEP 2019 - JUNE 2021

GPA: 3.85

Bachelor of Science in Computer Engineering **LIU, Beirut, Lebanon**

SEP 2016 - JUNE 2019

GPA: 4.0
